Thunderbird

POWERED BY CIOO LABS

Organisational data made available instantly

Metrics

- No. of APIs called via Thunderbird
- No. of Endpoints provided
- No. of Onboarded Users

Use cases

Product Vision:

- Thunderbird aims to transform the way organizational data is accessed and used within GovTech, shifting from manual, siloed processes to an AI-powered, self-serve model that empowers all officers to automate and innovate in their roles.

- Thunderbird hopes to solve costly duplication such as team integrations and repeated IP whitelisting by centralising connectivity and standardise sharing of structured and unstructured datasets.

- **Current state:** Thunderbird is a secure API gateway designed to simplify and automate access to data from GovTech's key internal systems, such as Workday and other SaaS platforms. It also now supports bring your own data

- **How it works:**
  - Users request an authorization token from Thunderbird and use it to call exposed API endpoints, retrieving data securely from protected internal systems
